# Disproportional Impact of COVID-19 on Marginalized Communities

David J Corliss, Peace-Work

---

With a PhD in statistical astrophysics, David Corliss has been working in SAS since SAS Date 12692. He is the founder and Director of Peace-Work, a volunteer cooperative of statisticians and data scientists applying statistical methods to issue-driven advocacy in poverty, education, social justice, and providing analytic support for charitable groups.

# OUTLINE

Disproportionate Impact

Study Methodology

County-Level Time Series Analysis

Other Disproportionate Impacts

Summary and Conclusions

# Disproportionate Impact

CDC Rate Ratios by Ethnicity - Cumulative as of March 6, 2021  
Based on the 53% of case reports that included race / ethnicity

## Risk for COVID-19 Infection, Hospitalization, and Death By Race/Ethnicity

Rate ratios compared to White, Non-Hispanic persons	American Indian or Alaska Native, Non-Hispanic persons	Asian, Non-Hispanic persons	Black or African American, Non-Hispanic persons	Hispanic or Latino persons
Cases <sup>1</sup>	1.7x	0.7x	1.1x	1.3x
Hospitalization <sup>2</sup>	3.7x	1.0x	2.9x	3.1x
Death <sup>3</sup>	2.4x	1.0x	1.9x	2.3x

Race and ethnicity are risk markers for other underlying conditions that affect health, including socioeconomic status, access to health care, and exposure to the virus related to occupation, e.g., among frontline, essential, and critical infrastructure workers.

# Disproportionate Impact

## Methodological Issues

- Many case reports do not report race / ethnicity
- Point in time data late in the pandemic averages the time series, understating the intrinsic risk
- Politicization has resulted in a degree of behavior-driven morbidity and mortality for certain groups

# Disproportionate Impact

## Methodological Issues

- Many case reports do not report race / ethnicity
- Point in time data late in the pandemic averages the time series, understating the intrinsic risk
- Politicization has resulted in a degree of behavior-driven morbidity and mortality for certain groups

=> Time series methods are needed for a full understanding of disproportionate impact

# Disproportionate Impact

## Metro Detroit Case Study: Early Evidence of Disproportionate Impact

# Study Methodology

## Series of Waves

# Study Methodology

## Summer Wave Not Found in All Areas

# Study Methodology

## Methodology Best Practices

- Track deaths rather than cases, which are often missed
- Adjust for population size => use Per Capita metrics
- County-Level data – NYT data based on screen-scraping county health department pages, complete and current
- First Wave shows intrinsic, underlying risks apart from political influences

# Study Methodology

## Methodology Best Practices

- Track deaths rather than cases, which are often missed
  - Adjust for population size => use Per Capita metrics
  - County-Level data – NYT data based on screen-scraping county health department pages, complete and current
  - First Wave shows intrinsic, underlying risks apart from political influences
- => Key Metric: Cumulative deaths per capita through Week 25 (June 27)

# County-Level Time Series Analysis

Wave 1: January – June 2020

Dividing all US counties into quintiles from lowest to highest BIPOC % of total population, each quintile has higher COVID mortality

# County-Level Time Series Analysis

Wave 2: July – Mid-September 2020

Summer Wave

Still high BIPOC  
mortality rate

Increasing mortality  
in counties with the  
least BIPOC %

# County-Level Time Series Analysis

## Wave 3: Late September - Present

Fall Wave

Long Predicted by  
Epidemiologists

Little differentiation  
in mortality by  
BIPOC %

# Other Disproportionate Impacts

COVID-19 impacts many social pathologies known to have disproportional impacts on marginalized communities, including addiction, domestic violence, suicide, human trafficking, and others

1. Identify risk factors and model score - Pre-COVID
2. Identify the factors impacted by the pandemic
3. Calculate Post-COVID values for each geography
4. Evaluate model score with new values
5. Calculate pre / post difference and % change

# Other Disproportionate Impacts

## Example: Impact of COVID-19 on Human Trafficking

- Poverty: % Below Poverty Line
- Affluence: Per Capita Income
- Gini Index: % Change
- New Homelessness: Foreclosure % Increase
- Race: % Persons of Color
- History of Legal Slavery: % in slavery in 1860
- Approach to Business Regulation: RTW

# Other Disproportionate Impacts

## Example: Impact of COVID-19 on Human Trafficking

- Poverty: % Below Poverty Line
- Affluence: Per Capita Income
- Gini Index: % Change
- New Homelessness: Foreclosure % Increase
- Race: % Persons of Color
- History of Legal Slavery: % in slavery in 1860
- Approach to Business Regulation: RTW

Affected by  
the Pandemic

# Other Disproportionate Impacts

Example: Impact of COVID-19 on Human Trafficking

#SASGF

SAS<sup>®</sup> GLOBAL FORUM 2021

# Summary of Time Series Analysis

Three distinct waves of the pandemic are seen:

- Initial: Feb-Jun, marginalized populations badly impacted
- Summer Wave: behavior-driven, only seen in Red States
- Fall Wave: worldwide, expected by epidemiologists

Politically-driven behaviors appear in Summer Wave with increases in Red States from disregarding safety measures

# Conclusions

- Disproportional impacts on marginalized populations are seen in COVID-19 per capita deaths rates
- Mortality rates increase with population percent BIPOC
- Intrinsic risk in BIPOC populations: Odds Ratio = 5.56
- Connections seen to other social pathologies with disproportionate impact on marginalized populations
